Brief Introduction

My name's Muhannad, I'm an ambitious senior Computer Science student at King Saud University. No matter what I work in, and despite whatever comes, I take pride in my work. Big or small.

Goal

I wish to extend and improve upon my experience in my own work field, generally in the workplace, and in teamwork. And to be exceptionally passionate about what work the future could and would bring.

Education

Ibn Khaldun Middle School – Manarat Al-Riyadh High School

Mawhiba Grant Alumni (September 2015 – May 2021)

This opportunity allowed me to have a much earlier proper introduction to teamwork and research, amongst the many other opportunities Mawhiba gave me throughout these years.

King Saud University

Bachelor's Degree, Computer Science (August 2021 – present)

Throughout my years as a bachelor's student, I have learnt about many aspects of Computer Science and have worked on those same aspects. Which not only gave me even more experience but also gave me a more thorough understanding of this vast field which seemed abstract from afar.

Experience

- A thorough experience in the university sector.
- Strong communication skills with team members spanning across nearly a decade.
- An exceptional 15-year expertise of the English language.
- A moderately excellent understanding of programming, various data structures, databases, and algorithm design with discrete math.

Skills

General skills:

- Public speaking
- Research and its structure
- Advanced English literacy
- Critical thinking and planning
- Moderate understanding of mathematics
- Attention to detail

Technical skills:

- Advanced understanding of Java
- Good understanding of C and Python
- Moderate understanding of SQL, HTML, CSS, and JavaScript.
- Moderate understanding and usage of Microsoft Excel.
- Decade-long understanding and usage of Microsoft PowerPoint, Word.

Projects

Ultra-Realistic Voice Generation and Text Annotation System for Quranic Translations (المرتل الذكي)

August 2024 – May 2025

It's a web-based system designed to generate voice files out of existing voices for Quranic translations. A user can have multiple projects, where each one has a version of Quran with a specific language to generate the voice file and export from.

I contributed to the report's writing and research alongside my colleagues and in establishing the connection of the database with the project's website using prominent Python web framework Flask.

An Implementation of A Phonebook Using Linked List and BST Data Structures In Java

September 2023 – December 2023

It's a project split into two phases, where me and two other colleagues implemented a phonebook project. First phase was with a linked list data structure, and the second was with a Binary Search Tree data structure. Where, depending on which structure was used, you add contacts (which would be sorted in alphabetical order in BST), add notes, search for them, add them to events, and more.
